

## Signal Processing Research Group

The advent of technological developments resulted in many signal acquisition methodologies for capturing the real time physical phenomenon. The acquired data must be effectively analyzed for better interpretation. Signal processing focuses on analyzing, modifying and synthesizing signals such as sound, images and scientific measurements. Signal processing techniques can be used to improve transmission, storage efficiency and subjective quality and to also emphasize or detect components of interest in a measured signal. Based on the nature of the signal acquired, number of sub domains of signal processing has been formulated like image processing, Bio medical signal processing, and video processing and so on depending on the physical measurement made.

### Objectives:

The objective is to provide research group members with the ability to identify the problem in the broad area of Signal processing and design as well as develop algorithms for real time applications. The objectives of the Signal processing group are:

- To provide an insight to the members about the developments in Signal processing Domain. with a detailed understanding of the operation, function and interaction between various components and sub-systems used in power electronic converters, electric machines and adjustable speed drives
- To educate the members about the areas that are correlated with and enable design and simulation of algorithms using popular software.
- To provide the member with experience of the practical implementation of Signal Processing Algorithms using Digital Signal Processors.
- To conduct staff colloquiums for sharing the knowledge among one another.
- To make use of facilities in the research group and produce quality publications.
- To conduct Faculty development Programs periodically on core areas of Signal Processing.
